Claim 13 (new): A non-transitory storing space with an executable program stored thereon, wherein the program instructs a computer in a router for time synchronizing between first and second communication networks to perform the following steps:

receiving first synchronizing data based on a reference time clock from said first communication network, and

exploiting said first synchronizing data to synchronize a local time clock used by said router with respect to said reference time clock,

wherein said time synchronizing method further comprises:

intercepting a message coming from an apparatus of said second communication network and directed to the first communication network, said apparatus of said second communication network having a specific time clock,

preparing a time request for said apparatus of said second communication network periodically or responsive to a state of said local time clock, said time request to be executed in said apparatus to cause second synchronizing data based on said

specific time clock to be obtained back from said apparatus and caching of said intercepted message,
 sending said time request to said apparatus, and
 forwarding said cached, intercepted message to said first communication network after said time request has been prepared,
 receiving said second synchronizing data from said apparatus and
